

# ALGORITHMS AND DATA STRUCTURES

Frederik Gailly

# PRACTICAL STUFF

## TOPICS A&D

- Algorithms and Data Structures
  - Files & Exception handling
  - Tuples, Sets and Dictionaries
  - Recursion
  - Efficient Algorithms
- 
- Web Application Development  
(only for group assignment)

# PLANNING

Week	Date	Time	Content
Week 1	23rd September 2025	11.30 → 12.45	On Campus: Intro + Practicalities
	24th September 2025	08.30 → 09.45	Online: Dodona exercises
Week 2	30th September 2025	11.30 → 12.45	On campus: Files & Exceptions / Tuples, Sets and Dicts
	1st October 2025	08.30 → 9.45	Online: Dodona exercises
Week 3	7th October 2025	11.30 → 12.45	On campus: Recursion
	8th October 2025	08.30 → 9.45	Online: Dodona exercises
Week 4	14th October 2025	11.30 → 12.45	On campus: Efficient Algorithms
	15th October 2025	08.30 → 9.45	Online: Dodona exercises
Week 5	21st October 2025	11.00 → 12.15	On campus: Insertion Sort + Linked List
	22nd October 2025	08.30 → 11.30	Lok 1.1 S2: Feedback Project
Week 6	28th October 2025	11.30 → 12.45	Project time
	29th October 2025	08.30 → 9.45	Project time
Week 7	4th November 2025	11.30 → 12.45	On Campus: Flask Python Web Application
	5th November 2025	08.30 → 9.45	Project time

# PLANNING

Week	Datum	Uur	Inhoud
Week 8	11th November 2025	11:30 → 12.45	No lecture
	12th November 2025	08.30 → 09.45	Project time
Week 9	18th November 2025	11:30 → 12.45	No Lecture
	19th November 2025	08.30 → 13.00	No Lecture
	19th November 2025	17.00 → 20.00	<b>Exam</b>
Week 10	25th November 2025	11.30 → 12.45	Project Time
	26th November 2025	08.30 → 11.30	Lok 1.1 S2: Feedback Project
Week 11	2nd December 2025	11.30 → 12.45	On Campus: Flask Best Practices
	3rd December 2025	08.30 → 11.30	Lok 1.1 S2: Feedback Project
Week 12	9th December 2025	11.00 → 12.15	Project time
	10th December 2025	08.30 → 12.30	Lok 1.1 S2: Feedback Project
<b>Week 13</b>	<b>19th December 2025</b>	<b>11.00</b>	<b>Deadline Group Assignment</b>

## ON CAMPUS LECTURE

- Tuesday 11.30 → 12.45u
- Where?
  - Week 1 Aud D - Plateau
  - Week 2 - ... : Aud Picard – Campus Tweeckerken
- Lecture will be recorded
- Week 1 until week 5

## ONLINE SESSIONS

- Wednesday 8.30 tot 09.45
- Online via Course MS Teams
- Goals:
  - Time to work on exercise
  - Ask questions
  - Prepare for the exam

# FEEDBACK PROJECT

- Starts week 7
- Reserve a slot with Bookings with me
- Feedback Sessions Teaching Assistant

# EVALUATION

- 50% project
- 50% PC exam

# EVALUATION

A&D	Database Systems	Evaluation	Remarks
Part of curriculum	Part of curriculum	<ul style="list-style-type: none"> <li>IS project</li> <li>DBS exam</li> <li>A&amp;D exam</li> </ul>	Grades separate parts can be transferred if >9
Part of curriculum	Exemption	<ul style="list-style-type: none"> <li>A&amp;D exam</li> <li>Individual or group project</li> </ul>	Grades separate parts can be transferred if >9
Exemption	Part of curriculum	<ul style="list-style-type: none"> <li>DBS exam</li> <li>Individual or group project</li> </ul>	Grades separate parts can be transferred if >9
Next year part of curriculum	Part of curriculum	<ul style="list-style-type: none"> <li>DBS exam</li> </ul>	Grade DBS are transferred to next year if > 9
Part of curriculum	Next year part of curriculum	<ul style="list-style-type: none"> <li>A&amp;D exam</li> </ul>	Grade A&D are transferred to next year if > 9

# EXAM ON COMPUTER

- 19 november 2025
- Open book
- Programming assignment
  - Design partly given
  - Focus is on implementation algorithms and data structures

# PROJECT

- Joint project A&D and Database systemen
- Two parts
  - Part 1:
    - Analysis requierments IS
    - Model, design and implementation of relational database
  - Part 2: Design, programming and testing IS

# PROJECT

- Important dates:
  - 12/10/2025: deadline creation groups
  - 13/10/2025: publication assignment
  - 19/12/2025: Deadline
  - Last week exams: Project defense
- Every group 6 students
  - Create groups in ufora
  - No exceptions

# PROJECT

- Evaluation
  - 30% joint evaluation
    - een peerassessment
    - Presentation slides
    - Oral presentation + defense
  - 70% linked to course content:
    - design
    - code
    - testing

# INTRO ALGORITHMS AND DATA STRUCTURES

# CONTENT

- Algorithms
  - Introduction
  - Binary Search
  - Sort algorithms
- Data structures
  - Introduction
  - Stack class

# ALGORITHMS

- Examples:
  - Search and Sort algorithms
  - Shortest Path problem: Dijkstra's algorithm
  - Travelling salesman problem
- Definition:

An algorithm is a finite, step-by-step sequence of instructions or a set of rules designed to perform a specific task or solve a problem. It takes an input, processes it, and produces an output in a defined manner.

# BINARY SEARCH

- For binary search to work, the elements in the list must already be ordered. Without loss of generality, assume that the list is in ascending order.
  - e.g., 2 4 7 10 11 45 50 59 60 66 69 70 79
- The binary search first compares the key with the element in the middle of the list.

## BINARY SEARCH, CONT.

Consider the following three cases:

- If the key is less than the middle element, you only need to search the key in the first half of the list.
- If the key is equal to the middle element, the search ends with a match.
- If the key is greater than the middle element, you only need to search the key in the second half of the list.

# BINARY SEARCH

- <https://liveexample.pearsoncmg.com/dsanimation/BinarySearchBook.html>

Key	List								
8	<table><tr><td>1</td><td>2</td><td>3</td><td>4</td><td>6</td><td>7</td><td>8</td><td>9</td></tr></table>	1	2	3	4	6	7	8	9
1	2	3	4	6	7	8	9		
8	<table><tr><td>1</td><td>2</td><td>3</td><td>4</td><td>6</td><td>7</td><td>8</td><td>9</td></tr></table>	1	2	3	4	6	7	8	9
1	2	3	4	6	7	8	9		
8	<table><tr><td>1</td><td>2</td><td>3</td><td>4</td><td>6</td><td>7</td><td>8</td><td>9</td></tr></table>	1	2	3	4	6	7	8	9
1	2	3	4	6	7	8	9		

# BINARY SEARCH

key is 54

key > 50

key < 66

key < 59

low high

[6] [7] [8]

## BINARY SEARCH

- The `binarySearch` method returns the index of the element in the list that matches the search key if it is contained in the list. Otherwise, it returns -1
- The `binarySearch` method can also return the insertion point
  - The insertion point is the point at which the key would be inserted into the list.

# FROM IDEA TO SOLUTION

# Use binary search to find the key in the list

```
def binarySearch(lst, key):
```

```
    low = 0
```

```
    high = len(lst) - 1
```

```
    while high >= low:
```

```
        mid = (low + high) // 2
```

```
        if key < lst[mid]:
```

```
            high = mid - 1
```

```
        elif key == lst[mid]:
```

```
            return mid
```

```
        else:
```

```
            low = mid + 1
```

```
    return -low - 1 # Now high < low, key not found
```

# SORTING LISTS

Sorting, like searching, is also a common task in computer programming. Many different algorithms have been developed for sorting. This section introduces two simple, intuitive sorting algorithms: selection sort and insertion sort.

# SELECTION SORT

Selection sort finds the smallest number in the list and places it first. It then finds the smallest number remaining and places it next to the first, and so on until the list contains only a single number.

Select 1 (the smallest) and swap it with 2 (the first) in the list

Select 2 (the smallest) and swap it with 9 (the first) in the remaining list

The number 1 is now in the correct position and thus no longer needs to be considered.

Select 4 (the smallest) and swap it with 5 (the first) in the remaining list

The number 2 is now in the correct position and thus no longer needs to be considered.

5 is the smallest and in the right position. No swap is necessary

The number 6 is now in the correct position and thus no longer needs to be considered.

Select 6 (the smallest) and swap it with 8 (the first) in the remaining list

The number 5 is now in the correct position and thus no longer needs to be considered.

Select 8 (the smallest) and swap it with 9 (the first) in the remaining list

The number 6 is now in the correct position and thus no longer needs to be considered.

Since there is only one element remaining in the list, sort is completed

The number 8 is now in the correct position and thus no longer needs to be considered.

# SELECTION SORT ANIMATION

- <https://liveexample.pearsoncmg.com/dsanimation/SelectionSortNew.html>

# FROM IDEA TO SOLUTION

```
for i in range(len(lst)):
    select the smallest element in lst[i.. len(lst)-1]
    swap the smallest with lst[i], if necessary
    # lst[i] is in its correct position.
    # The next iteration apply on lst[i+1..len(lst)-1]
```

```
lst[0] lst[1] lst[2] lst[3] ... lst[10]
```

```
lst[0] lst[1] lst[2] lst[3] ... lst[10]
```

```
lst[0] lst[1] lst[2] lst[3] ... lst[10]
```

```
lst[0] lst[1] lst[2] lst[3] ... lst[10]
```

```
lst[0] lst[1] lst[2] lst[3] ... lst[10]
```

...

```
lst[0] lst[1] lst[2] lst[3] ... lst[10]
```

# EXPAND

```
for i in range(0, len(lst)):  
    select the smallest element in lst[i.. len(lst)-1]  
    swap the smallest with lst[i], if necessary  
    # lst[i] is in its correct position.  
    # The next iteration apply on lst[i+1..len(lst)-1]  
  
    currentMin = min(lst[i : ])
```

Note: this is a new version much simpler  
than the one in the book.

# EXPAND

```
for i in range(0, len(lst)):
    select the smallest element in lst[i.. len(lst)-1]
    swap the smallest with lst[i], if necessary
    # lst[i] is in its correct position.
    # The next iteration apply on lst[i+1..len(lst)-1]

    currentMin = min(lst[i : ])
    currentMinIndex = i + lst[i : ].index(currentMin)

    # Swap lst[i] with lst[currentMinIndex] if necessary
    if currentMinIndex != i:
        lst[currentMinIndex], lst[i] = lst[i], currentMin
```

# WRAP IT IN A FUNCTION

```
# The function for sorting elements in ascending order
def selectionSort(lst):
    for i in range(len(lst) - 1):
        # Find the minimum in the lst[i : len(lst)]
        currentMin = min(lst[i : ])
        currentMinIndex = i + lst[i: ].index(currentMin)

        # Swap lst[i] with lst[currentMinIndex] if necessary
        if currentMinIndex != i:
            lst[currentMinIndex], lst[i] = lst[i], currentMin
```

Invoke it

```
selectionSort(yourList)
```

# DATA STRUCTURES

- Example: List, Set, Stack, Row, Binary Tree, Hashing Table, Dictionary

- Definition:

A data structure is a specialized format for organizing, managing, and storing data in a way that enables efficient access and modification. It defines the relationships between data elements and provides methods for performing operations such as searching, sorting, inserting, updating, and deleting data.

# STACK ANIMATION

<https://liveexample.pearsoncmg.com/dsanimation/StackeBook.html>

Stack Animation by Y. Daniel Liang

Enter a value and click the Push button to push the value into the stack. Click the Pop button to remove the top element from the stack.

Enter a value:

# THE STACK CLASS

- You can define a class to model stacks. You can use a list to store the elements in a stack.
- There are two ways to design the stack and queue classes:
  - Using inheritance: You can define a stack class by extending list.
  - Using composition: You can create a list as a data field in the stack class.

# THE STACK CLASS

Stack	
-elements: list	A list to store elements in the stack.
+Stack()	Constructs an empty stack.
+isEmpty(): bool	Returns True if the stack is empty.
+peek(): object	Returns the element at the top of the stack without removing it from the stack.
+push(value: object): None	Stores an element into the top of the stack.
+pop(): object	Removes the element at the top of the stack and returns it.
+getSize(): int	Returns the number of elements in the stack.
